

Task 1, 2: Find 3 Real AI/ML Applications in Uzbekistan, Summary Table

Application	Sector	ML Type	Data Used
Click payment analytics & fraud monitoring	Fintech	Supervised learning (classification) + anomaly detection	Transaction data, user behavior, payment patterns
Zukko.AI sales chatbot	Business / CRM	NLP + generative AI	Customer chats, voice messages, product catalog
AI medical assistant (e-government healthcare)	Healthcare / Government	NLP + supervised learning	Patient records, voice input, medical history

Task 3: Explanation Paragraphs

1. Click Fraud Detection & Analytics

Click is a major digital payment platform in Uzbekistan, and like other fintech systems, it likely uses machine learning to detect suspicious transactions. This is probably based on supervised classification because the system needs labeled examples of fraudulent and legitimate payments. It may also use anomaly detection to identify unusual behavior patterns. The model would rely on transaction history, user behavior, and payment frequency. This is an informed assumption based on common fintech practices.

2. Zukko.AI Sales Chatbot

Zukko.AI provides AI-powered chatbots that automatically respond to customers on platforms like Telegram and Instagram. The system can understand slang, process voice messages, and generate responses, which indicates the use of NLP and generative AI. It is trained on conversation data and product information to guide users through purchases. According to the platform, it processes large volumes of conversations and automates customer interactions .

3. AI Medical Assistant (Uzbekistan e-government)

The government of Uzbekistan is implementing AI in healthcare, including digital medical assistants with voice input. These systems help doctors and patients by analyzing medical data and speech input. This likely uses NLP (for speech and text understanding) combined with supervised learning (for diagnosis or recommendations). It requires patient records, symptoms, and historical medical data. This is based on official reports about AI integration into public healthcare systems.
